

A gentle test for prioritizing embryo transfer that helps you have a healthy pregnancy

by Igenomix

EMBRACE is an embryonic cell-free DNA test that helps you and your doctor decide which embryo to prioritize and transfer first during your IVF cycle.

EMBRACE helps us to understand if your embryos have the correct number of chromosomes, which significantly increases their chances of leading to a successful pregnancy.

m

Peace of mind: Knowing more about your embryos can help you make the most informed decisions.

Embryos obtained from **IVF treatment** naturally release DNA during their development in the laboratory. The embryo develops in a drop of liquid called **culture medium**. As it grows, the embryo **releases DNA** into the culture medium. Highly-trained embryologists collect this liquid and send it to us for testing.

We analyze this liquid at Igenomix to detect the DNA released from the embryo. This allows us to provide you with a result that indicates which **embryos are most likely to be chromosomally normal** and are therefore optimal for transfer.

Benefits

- EMBRACE is an embryonic cell-free DNA test that does not require embryo biopsy.
- Helps decide which embryo to prioritize and transfer first.
- Makes treatment more accessible.

Embryos remain safely in your IVF clinic as the test is performed.
